The ™Gigabuch is a reading-format-application for internet users. It consists of three functional areas, the online-reading-book, the download-reading-units and the author's shop. The idea for a Gigabook-format orientates at the principles of the reading comfort.

2. The prototype

The prototype of a Gigabook is the ®*Giga-buch Michael,* which - as a mediagenic & literature-appropriate genre - has developed the

futuregraphy. As a reading portal it consists of a functional area and the text area. It is the aim to realize the text as a virtual and multimedial book. In the conventional book edition already 10 of 16 volumes were published one by one. It is already unavailable for a long time.
